

# Netflix SQL Project Report

This report explains the Netflix SQL Project and demonstrates how SQL queries were used to solve real-world business problems using Netflix content data. The project focuses on analyzing movies and TV shows, identifying patterns, improving decision-making, and generating insights that help a streaming platform improve customer engagement, content planning, and operational efficiency.

## 1. Count Movies vs TV Shows

**Problem Solving Approach:** The query groups content by type to determine how many Movies and TV Shows exist on the platform.

**Business Issue Solved:** This helps Netflix understand content distribution and maintain the right balance between movies and episodic content.

**Business Impact:** The company can make better investment decisions for future productions and licensing.

## 2. Most Common Rating by Content Type

**Problem Solving Approach:** Window functions and ranking were used to identify the most frequent rating for each content type.

**Business Issue Solved:** This helps Netflix understand audience maturity preferences and regional viewing behavior.

**Business Impact:** The result supports better recommendation systems and parental control strategies.

## 3. Movies Released in 2020

**Problem Solving Approach:** The query filters movies released in a specific year.

**Business Issue Solved:** Netflix can track yearly content releases and compare production trends.

**Business Impact:** This helps in measuring content growth and yearly performance analysis.

## 4. Top 5 Countries with Most Content

**Problem Solving Approach:** Country values were separated using `STRING_TO_ARRAY` and `UNNEST` functions to properly analyze multiple countries.

**Business Issue Solved:** This solves the issue of combined country names stored in a single field.

**Business Impact:** Netflix can identify major production markets and focus investments in high-performing regions.

## 5. Identify the Longest Movie

**Problem Solving Approach:** The query uses MAX(duration) to locate the movie with the greatest runtime.

**Business Issue Solved:** This helps understand audience engagement patterns for long-form content.

**Business Impact:** It also supports content categorization and viewer experience optimization.

## 6. Content Added in the Last 5 Years

**Problem Solving Approach:** Date conversion functions were used to filter recently added content.

**Business Issue Solved:** This helps track recent platform expansion and active content acquisition.

**Business Impact:** Netflix can measure catalog freshness and customer retention strategies.

## 7. Find Content by Director Rajiv Chilaka

**Problem Solving Approach:** LIKE filtering was used to search for content from a specific director.

**Business Issue Solved:** This supports creator-based analysis and personalized recommendations.

**Business Impact:** Netflix can evaluate director performance and audience demand.

## 8. TV Shows with More than 5 Seasons

**Problem Solving Approach:** SPLIT\_PART and numeric conversion were used to extract season counts.

**Business Issue Solved:** This solves the issue of text-based duration values.

**Business Impact:** The insight helps Netflix identify long-running successful shows.

## 9. Count Content by Genre

**Problem Solving Approach:** Genres were separated and grouped to calculate total content in each category.

**Business Issue Solved:** This helps Netflix identify the most popular genres.

**Business Impact:** The results support recommendation engines and content acquisition planning.

## 10. Average Content Released in India by Year

**Problem Solving Approach:** The query calculates yearly content percentages for India.

**Business Issue Solved:** This provides insight into regional content growth trends.

**Business Impact:** Netflix can improve localization strategies and regional expansion planning.

## 11. List Documentary Movies

**Problem Solving Approach:** The query filters documentary content using genre matching.

**Business Issue Solved:** This helps analyze educational and informational content availability.

**Business Impact:** The company can better understand niche audience interests.

## 12. Find Content Without a Director

**Problem Solving Approach:** NULL value checks were used to identify missing director information.

**Business Issue Solved:** This improves data quality and metadata management.

**Business Impact:** Netflix can clean incomplete records and improve search accuracy.

## 13. Salman Khan Movies in Last 10 Years

**Problem Solving Approach:** Actor-based filtering combined with release year analysis was used.

**Business Issue Solved:** This helps track celebrity influence and audience popularity.

**Business Impact:** Netflix can optimize celebrity-focused marketing strategies.

## 14. Top 10 Actors in Indian Movies

**Problem Solving Approach:** The query separates actor names and counts appearances.

**Business Issue Solved:** This helps identify highly active and popular actors in Indian cinema.

**Business Impact:** Netflix can use this data for casting trends and recommendation algorithms.

## 15. Categorize Content as Good or Bad

**Problem Solving Approach:** CASE statements and keyword analysis were used to classify content.

**Business Issue Solved:** This helps identify violent or sensitive content.

**Business Impact:** The company can strengthen content moderation and parental guidance systems.

---

## **Final Conclusion**

This Netflix SQL Project demonstrates how SQL can transform raw entertainment data into meaningful business insights. Through 15 analytical problems, the project solved issues related to content distribution, audience preferences, data quality, regional growth, actor popularity, genre trends, and content safety analysis. The queries provide valuable results that help Netflix improve strategic planning, optimize content recommendations, strengthen data management, and enhance customer satisfaction. Overall, this project shows how SQL analytics supports better business decisions in the streaming industry by converting data into actionable insights.
